

Abstract

Natural organic impalpable powder is adhered to at least on a side in direct contact with the skin of a skin contact goods applied to skin. When the skin contact goods is, for instance, a sanitary goods having a surface material directly applied to the skin and an absorbing body covered with the surface material, the natural organic impalpable powder having an average particle size of less than $30\mu\text{m}$ is adhered by processing base of the surface member with a treatment. The treatment includes the natural organic impalpable powder and at least one of dispersion medium selected from the group consisting of water, organic solvent, resin emulsion and resin aqueous solution. By the above arrangement, moisture inhalation and touch of the surface material in direct contact with the skin can be improved.
